AMENDMENTS TO THE CLAIMS

1. (currently amended) A closing unit of a three-plate injection-molding machine comprising a die plate-(1), a movable mold-clamping plate-(2) and an end plate-(3), wherein the die plate-(1) and the end plate-(3) are connected to one another via tie bars-(4) on which the movable mold-clamping plate-(2) is displaceably guided, and wherein a toggle-lever arrangement-(5) on which a drive unit-(6) acts is provided between the end plate-(3) and the movable mold-clamping plate (2),

characterized in that

an encasing element-(13) of variable length extends between the end plate-(3) and the movable mold-clamping plate-(2).

- (currently amended) A closing unit according to claim 1, characterized in that the encasing unit-(13) is constructed as a bellows.
- 3. (currently amended) A closing unit according to claim 1, characterized in that the encasing element-(13) is constructed as a lining comprising at least two tunnel-like sheet-metal parts-(14, 15, 16) that can be displaced telescopically relative to one another.
- (currently amended) A closing unit according to claim 1, characterized in that the encasing element-(13) has an open structure in its lower region.
- 5. (currently amended) A closing unit according to claim 4,
 characterized in that
 the a lower opening of the encasing element is disposed above a collecting trough.

- 6. (cancelled)
- 7. (currently amended) A closing unit according to claim 1,
 characterized in that
 the encasing element-(13) is braced on by the tie bars-(4) between the end plate-(3) and
 the movable mold-clamping plate-(2).
- 8. (currently amended) A closing unit according to claim 1, characterized in that the length variability of the encasing element (13) is limited to a partial region of its length.
- 9. 10. (cancelled)
